

\$OLA Economic Circuit

The \$OLA token serves as the core engine of the Solates ecosystem — connecting education, DeFi participation, and sustainable token utility in one continuous value loop.

1. Pre-TGE Phase — Learning & Early Mining Access

Before the Token Generation Event (TGE), users participate in an educational journey that introduces the fundamentals of Solana and DeFi.

XP Accumulation: Users complete quests and accumulate XP through the Solates Point System.

Mining Room Unlock: At 500 XP, users unlock access to the Mining Room — a pre-TGE investment environment.

Spot Activation: Each user can mint up to 5 mining spots, activated with a 1 USDC fee per spot.

Base Yield: Each spot provides a symbolic base mining rate of 0.00001 \$OLA/day, representing early network contribution.

Users may enhance their spots through multipliers — optional upgrades representing higher staking commitments:

Tier	Cost (USDC)	Yield Multiplier	Example Output
Base	10	x1	0.00001 \$OLA/day
Enhanced	+20	x2	0.00002 \$OLA/day
Pro	+30	x5	0.00005 \$OLA/day
Elite	+50	x10	0.00010 \$OLA/day

Mining rewards are non-auto-compounded and accumulate as pre-TGE simulated OLA, which can later be converted to real \$OLA or staked for stOLA after launch.

2. TGE Phase — Transition to Real Yield

At the Token Generation Event, all pre-TGE balances are consolidated. Users may convert their pre-mined OLA and USDC contributions into live \$OLA tokens, activating the **staking and liquidity systems**.

- **stOLA Launch:** Users can stake OLA for stOLA, an interest-bearing derivative token representing compounded OLA yield.
- **Liquidity Pools:** Dual-asset pools (OLA/SOL and OLA/USDC) ensure deep liquidity and stable price discovery.
- **Governance Activation:** Stakers gain voting rights to guide future protocol utilities.

3. Future Utilities – Sustained Value Creation

Post-TGE, \$OLA evolves into a multi-utility token within the Solates ecosystem:

- **Staking Expansion:** Long-term yield through automated compounding and DAO participation.
- **Lending Markets:** Use \$OLA and stOLA as collateral for borrowing or leveraged yield.
- **Predictive Systems & DeFi Games:** Mission-based DeFi strategies where performance directly affects rewards.
- **P2P Marketplace:** Future real-world exchange hub enabling asset-to-asset trades without fiat conversion (advanced phase).

Sustainability Model

\$OLA's economy is designed around a self-reinforcing feedback loop:

1. **Learn** → users gain XP and \$OLA exposure.
2. **Invest** → early contributions fund liquidity and ecosystem growth.
3. **Earn** → staking and DeFi participation generate sustainable yield.
4. **Reinvest** → yields can be recycled into governance, lending, or liquidity.

This creates a closed, non-inflationary cycle that rewards commitment and long-term participation.

\$OLA ECONOMIC CIRCUIT

The SOLA token serves as the core engine of the Solates ecosystem — connecting education. DeFi participation, and sustainable token utility in one continuous value loop.

PRE-TGE PHASE

LEARNING QUESTS

MINING ROOM UNLOCK

At 500 XP, users unlock access to the Mining Room — a pre-TGE investment environment.

SPOT ACTIVATION

Each user can mint up to 5 mining spots, activated with a 1 USD fee per spot.

MULTIPLIERS

Tier	Cost (USDC)	Yield Multiplier
Base	10	x1
Enhanced	+20	x2
Pro	+30	x5
Elite	+50	x10

Mining rewards are non-auto-compounded and accumulate as pre-TGE simulated OLA, which can later be converted to real SOLA or staked for stOLA after launch.

TGE PHASE

TGE EVENT

At the Token Generation Event, all pre-TGE balances are consolidated

FUTURE UTILITIES

STAKING

LIQUIDITY

GOVERNANCE

Post-TGE, SOLA evolves into a multi-utility token within the Solates ecosystem.
